Question 1)

Points:

Maximum points: $4+0,5+0,5+1+0,5+0,5=7$

- a) A scientific experiment produces 35 petabytes ($35 * 2^{50}$ Byte) of data per year, which need to be stored. What is the height of a stack of storage media, if for storing the data CDs (capacity: 650 MB = $650 * 10^6$ Byte, thickness: 1.2 mm) are used?

- Calculate the solution for 35 PB = $35 * 2^{50}$ Byte

Number of CDs: $\frac{35 * 2^{50} \text{ Byte}}{650 * 10^6 \text{ Byte}} \approx 60,625,379.60$

Height of the CD stack: $60,625,380 * 1.2 \text{ mm} = 72,750,456 \text{ mm} \approx 72.75 \text{ km}$

- Calculate the solution for 35 PB = $35 * 10^{15}$ Byte

Number of CDs: $\frac{35 * 10^{15} \text{ Byte}}{650 * 10^6 \text{ Byte}} = \frac{35 * 10^9 \text{ Byte}}{650 \text{ Byte}} \approx 53.846.153,85$

Height of the CD stack: $53,846,154 * 1.2 \text{ mm} \approx 64,615,384.62 \text{ mm} \approx 64.62 \text{ km}$

- b) Name an advantage of serial data transmission compared with parallel data transmission.

Fewer wires are required.

- c) Name an advantage of parallel data transmission compared with serial data transmission.

Higher throughput.

- d) Do computer networks usually implement parallel or serial data transmission?

Serial data transmission.

- e) What describes the physical topology of a computer network?

It describes the wiring.

- f) What describes the logical topology of a computer network?

It describes the flow of data between the network devices.

Question 2)

Points:

Maximum points: 4

A scientific experiment produces 30 petabytes ($30 * 2^{50}$ Byte) of data per year. How much time requires the transmission of the data via an Ethernet with a bandwidth of 1 gigabit per second?

Ethernet bandwidth:

$$\begin{aligned} 1 \text{ Gbit/s} &= 1,000,000,000 \text{ Bit/s} \\ &= 125,000,000 \text{ Byte/s} \end{aligned}$$

Transfer time:

$$\frac{30 * 2^{50} \text{ Byte}}{125,000,000 \text{ Byte/s}} \approx 270,215,977.65 \text{ s}$$

$$\approx 4,503,600 \text{ Minutes}$$

$$\approx 75,060 \text{ Hours}$$

$$\approx 3,127.5 \text{ Days}$$

$$\approx 8.56 \text{ Years}$$

(Each year has 365,25 days!)

Question 3)

Points:

Maximum points: 6

A webcam at the surface of planet Mars sends pictures to Earth. Each image has a size of 30 MB (1 MB = 2^{20} Byte). How quickly, after a picture is taken, can it reach Mission Control on Earth?

(Note: The network connection is a point-to-point link.)

Data rate = 256 kbps (kilobit per second)

Signal propagation speed = 299.792.458 m/s

Waiting time = 0 s

Distance = 55.000.000.000 m

(Note: The distance between Earth and Mars fluctuates between approx. 55,000,000 km and approx. 400,000,000 km. For the further calculations, we use the 55,000,000 km, which is the distance from Earth to Mars, when they are closest together.)

Solution:

File size: 30 MB = 31,457,280 Bytes = 251,658,240 Bits

Data rate: 256,000 Bits/s

Latency = propagation delay + transmission delay + waiting time

Propagation delay = $55,000,000,000 \text{ m} / 299,792,458 \text{ m/s} \approx 183.46 \text{ s}$

Transmission delay = $251,658,240 \text{ Bits} / 256,000 \text{ Bits/s} \approx 983.04 \text{ s}$

Waiting time = 0 s

Latency = $183.46 \text{ s} + 983.04 \text{ s} + 0 \text{ s} \approx 1,166.5 \text{ s} = 19 \text{ m } 27 \text{ s}$

Question 4)

Points:

Maximum points: 12+1+1=14

a) Fill out all empty fields.

(Please fill in each empty cell only one correct answer!)

ISO/OSI Reference Model

Layer	Protocol	Device	Sort of Data (data unit)	Addresses
7 Application Layer	SMTP, HTTP, POP3, SSH...		Message	
6 Presentation Layer				
5 Session Layer				
4 Transport Layer	TCP, UDP	(VPN-)Gateway	Segment	Port number
3 Network Layer	IP, ICMP	Router, L3-Switch	Packet	IP address
2 Data Link Layer	Ethernet, Wifi, Bluetooth, PPP...	Bridge, L2-Switch, Modem	Frame	MAC address
1 Presentation Layer	Ethernet, Wifi, Bluetooth...	Repeater, Hub	Signal	

b) Mark the IP address of the Default Gateway in the output of route -n.

```
# route -n
Kernel IP routing table
Destination Gateway Genmask Flags Metric Ref Use Iface
0.0.0.0 192.168.0.1 0.0.0.0 UG 1024 0 0 eth0
192.168.0.0 0.0.0.0 255.255.255.0 U 0 0 0 eth0
```

c) Mark the MAC address of the Default Gateway in the output of arp -n.

```
# arp -n
192.168.0.191 ether 00:11:32:1c:03:f3 C eth0
192.168.0.21 ether 1c:b0:94:c4:a2:74 C eth0
192.168.0.1 ether 08:96:d7:2a:c6:06 C eth0

Question 5)

Points:

Maximum points: 1+2+2+2=7

- a) Why is it impossible to connect different buildings with shielded cables?

Shields must be electrically grounded on both sides of the cable. If only one end of a shielded cable is grounded, an antenna effect occurs, which results in a compensation current.

- b) Name a benefit and a drawback of mono-mode (single-mode) fibers compared with multi-mode fibers.

Advantage: Can be used for long distances (up to about 70 km).

Drawback: Only a single propagation mode.

- c) Name a benefit and a drawback of multi-mode fibers compared mono-mode (single-mode) fibers.

Advantage: Several thousand propagation modes.

Drawback: Can only be used for short distances (up to about 500 m).

- d) The following information come from existing twisted pair network cables. What information is provided about the shielding of these cables?

- E138922 RU AWM 2835 24 AWG 60°C CSA LL81295 FT2 ETL VERIFIED
EIA/TIA-568A CAT.5 UTP EVERNEW G3C511

Question 6)

Points:

Maximum points: 1+1+1+1+1=5

- a) What is the purpose of Repeaters in computer networks?

A Repeater retransmits all received signals at a higher level or higher power, so that the signal can cover longer distances.

- b) What is the major difference between Repeaters and Hubs?

Hubs are Repeaters with > 2 interfaces.

- c) Why do Repeaters and Hubs not require physical or logical addresses?

Repeaters and Hubs have no physical or logical network addresses because they just forward the received signals.

- d) What network topologies do Hubs implement?

Physical topology: Star network because of the cabling.

Logical topology: Bus network, because equal to a long cable, were all network devices are connected with, a Hub forwards incoming signals to all other interfaces.

- e) What is a collision domain?

The collision domain is a network or a section of a network where multiple network devices use a shared transmission medium. It includes all network devices which compete for accessing a shared transmission medium.

Question 7)

Points:

Maximum points: $1+2+2+1+1=7$

- a) Describe the functioning of the line code Non-Return-To-Zero (NRZ)?

It represents logical 0 and 1 is by using different voltage levels.

- b) What two problems can occur, when NRZ is used to encode data?

Baseline Wander and Clock Recovery.

- c) How can the problems from subtask b) be avoided? *In order to prevent Baseline Wander, when using a line code with 2 physical signal levels, the usage of both signal levels must be equally distributed.*

One way to avoid the clock recovery problem is by using a separate line, which transmits just the clock. In computer networks, a separate signal line just for the clock is not practical because of the cabling effort. Instead, it is recommended to increase the number of guaranteed signal level changes to enable the clock recovery from the data stream.

- d) Why is it important for the receiver of signals, which are encoded according to the Differential Manchester Encoding, to know the initial signal level?

Depending on the initial signal level, two signal sequences, inverse to each other, are possible.

- e) Why do some line codes, that map groups of payload bits onto groups of code bits, implement variants with neutral inequality, positive inequality and negative inequality?

Variants with positive or negative inequality alternate to prevent Baseline Wander.

Question 8)

Points:

Maximum points: $1+1+1+1+1+1+1=7$

- a) What is the purpose of Bridges in computer networks?

For connecting different physical networks, Bridges are required because they forward frames from one physical network to another one.

Bridges and Switches check the correctness of the frames via checksums.

- b) Why do Bridges try to avoid loops?

Loops can cause malfunctions and reduce the performance of the network or even lead to a network failure.

- c) What protocol use Bridges to handle loops?

Spanning Tree Protocol (STP).

- d) What is the selection criteria for determining, whether a Bridge becomes the Root Bridge?

First, the Bridges have to determine the Bridge with the lowest Bridge Priority in the Bridge ID. This Bridge is the Root Bridge of the spanning tree to be generated.

- e) What is a Designated Bridge and what is its task?

For each physical network, a single one of the directly connected Bridges needs to be selected as responsible for forwarding the frames towards in the direction of the Root Bridge. This Bridge is called Designated Bridge for this network.

- f) How many Designated Bridges does a computer network contain?

For each physical network, a single Designated Bridge exists.

- g) What is the impact of Bridges and Layer-2-Switches on the collision domain?

If a physical network is subdivided via a Bridge or Switch, also the collision domain is divided and the number of collisions decreases.

Question 9)

Points:

Maximum points: 2+2+2+2=8

The character-oriented protocol BISYNC uses control characters to mark the structure of the frames. The start of a frame highlights the character SYN. The start of the header highlights the character SOH (*Start of header*). The payload is located between STX (*Start of text*) and ETX (*End of text*).

If the payload (body) contains the control characters ETX and DLE (*Data Link Escape*), they are protected (*escaped*) by the Data Link Layer protocol with a stuffed DLE character. A single ETX in the payload area is represented by the sequence DLE ETX. The DLE character itself is represented by the sequence DLE DLE.

Control character	SOH	STX	ETX	DLE	SYN
Hexadecimal notation	01	02	03	10	16

Mark the payload inside the following BISYNC frames?

a) 16 16 01 99 98 97 96 95 02 C1 12 34 56 78 90 C2 03 A0 B7

The payload is:

C1 12 34 56 78 90 C2

b) 16 16 01 99 98 97 96 95 02 B1 10 10 10 10 10 10 10 10 10 10 B3 03 76 35

The payload is:

Question 11)

Points:

Maximum points: 5+3=8

- a) Split the class A network 16.0.0.0 for implementing 513 subnets. Calculate the subnet masks and answer the questions.

Network ID: 00010000.00000000.00000000.00000000 16.0.0.0

Number of bits for subnet IDs? $513 \implies 1024 = 2^{10} \implies 10$ bits for subnets

Subnet mask: 11111111.11111111.11000000.00000000 255.255.192.0

Number of bits for host IDs? 14

Number of host IDs per subnet? $2^{14} = 16384$

Two addresses cannot be assigned to network devices because they are the network address and the broadcast address!

- b) The sender transmits an IP packet to a receiver. Calculate the subnet ID of sender and receiver and specify whether the IP packet leaves the subnet during transmission or not.

Sender: 10000100.10011000.01010011.11111110 132.152.83.254

Subnet mask: 11111111.11111111.11111100.00000000 255.255.252.0

AND -----
11000100.10011000.01010000.00000000 20 => Subnetznummer

Receiver: 10000100.10011000.01010001.00000010 132.152.81.2

Subnet mask: 11111111.11111111.11111100.00000000 255.255.252.0

AND -----
11000100.10011000.01010000.00000000 20 => Subnetznummer

Subnet ID of sender? 20

Subnet ID of receiver? 20

Does the IP packet leave the subnet [yes/no]? no

Question 12)

Points:

Maximum points: $1+1+2+1=5$

- a) Describe one example, where using the Transport Layer protocol TCP makes sense.
TCP is used for Email transmission, file transmission and web page transmission because no part of the information is allowed to get lost.
- b) Describe one example, where using the Transport Layer protocol UDP makes sense.
If UDP is used for video transmission or video telephony, the only consequence of losing a segment is losing an image.
- c) Which two possible reasons for the occurrence of congestion in computer networks exist?
Receiver capacity. The receiver can not process the received data fast enough and therefore its receive buffer becomes full.
Network capacity. Congestion of the network occurs.
- d) Why does the sender maintain two windows when using TCP and not just a single one?
The Advertised Receive Window avoids congestion of the receiver.
The Congestion Window avoids congestion of the network.

Question 13)

Points:

Maximum points: 2+1+1=4

a) Mark in the figure the slow-start phase and the congestion avoidance phase both.

b) Describe what fast retransmit is?

After three duplicate ACKs arrived, the lost segment is sent again.

c) Describe what fast recovery is?

The slow-start phase after three duplicate ACKs arrived is avoided. If three duplicate ACKs arrive, the congestion window is set directly on the threshold value.
